Radiative $K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay

The matrix element for $K \rightarrow \pi^0 e \nu \gamma$ has general structure

$$T = \frac{G_F}{\sqrt{2}} e V_{us} \varepsilon^\mu(q) \left\{ (V_{\mu\nu} - A_{\mu\nu}) \bar{u}(p_\nu) \gamma^\nu (1 - \gamma_5) v(p_l) \right. \quad (1)$$

$$\left. + \frac{F_\nu}{2p_l q} \bar{u}(p_\nu) \gamma^\nu (1 - \gamma_5) (m_l - \not{p}_l - \not{q}) \gamma_\mu v(p_l) \right\} \equiv \varepsilon^\mu A_\mu.$$

First term of the matrix element describes Bremsstrahlung of kaon and direct emission (Fig. 1a). The lepton Bremsstrahlung is presented by second part of Eq(1) and (Fig. 1b).

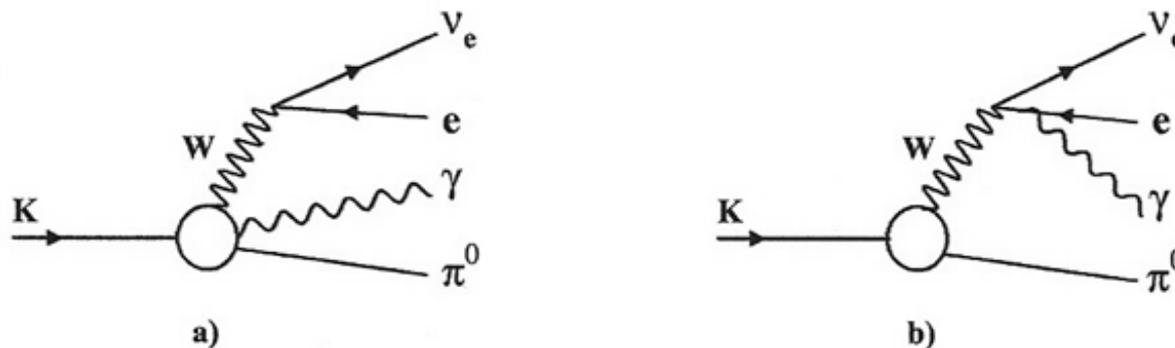

Figure 1: Diagrammatic representation of the $K_{l3\gamma}$ amplitude.

Radiative $K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay

The radiative $K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay allow us to perform quantitative tests CHPT, thanks to theoretical developments over the past couple of decades as well as recent and ongoing high-statistics experimental studies.

The first complete analysis within CHPT to $O(p^4)$ order was performed by Bijinens et al. [Nucl. Phys. B396 (1993) 81]. Recently, the CHPT analysis was revisited and extended to $O(p^6)$ Kubis et al. [Eur Phys. J. C50 (2007) 557].

$K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay is one of kaon decays where new physics beyond Standard model can be probed. This decay is especially interesting as it is sensitive to T-odd contributions. According to CPT theorem, observation of T violation is equivalent to observation of CP-violating effects.

OKA: search for T-violation in K^+ decays

Important experimental observable used in CP-violation searches is the T-odd correlation for $K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay defined as

$$\xi_{\pi e \gamma} = \frac{1}{M_K^3} p_\gamma \cdot [p_\pi \times p_e] \quad (2)$$

To establish the presence of a nonzero triple-product correlations, one constructs a T-odd asymmetry of the form

$$A_\xi = \frac{N_+ - N_-}{N_+ + N_-} \quad (3)$$

Where N_+ and N_- are number of events with $\xi > 0$ and $\xi < 0$

PDG 2016

$$R = \Gamma(K^+ \rightarrow \pi^0 e^+ \nu \gamma) / \Gamma(K^+ \rightarrow \pi^0 e^+ \nu) = (2.56 \pm 0.16) \cdot 10^{-4}$$

$$A(\xi) = -0.022 \pm 0.024$$

IHEP PS U-70

U-70 ring

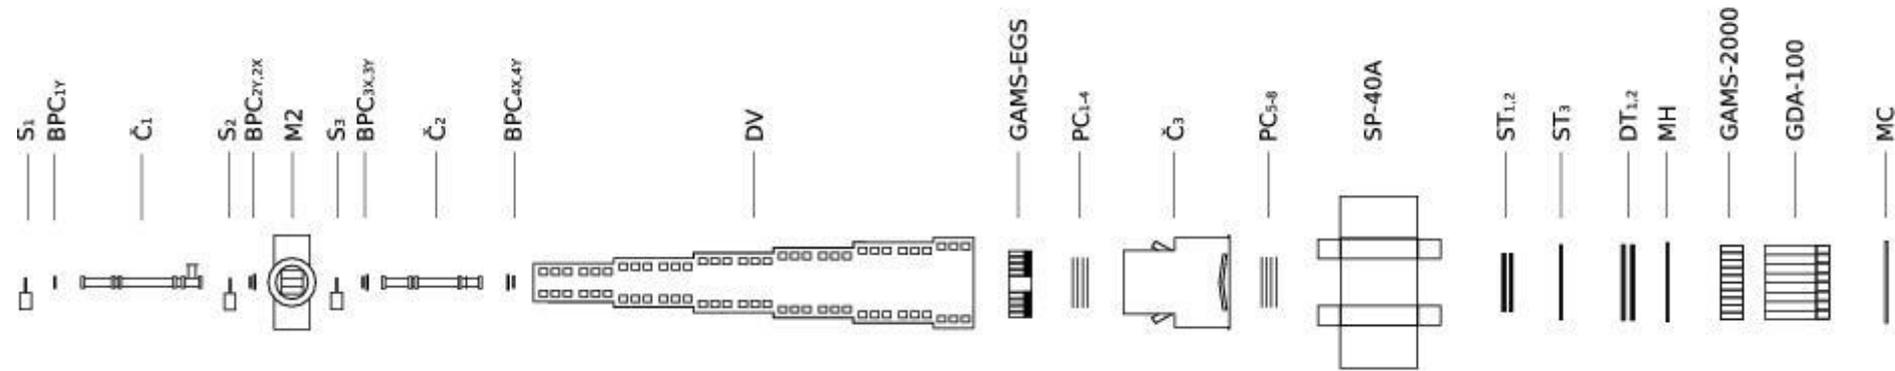

IHEP Protvino

OKA collaboration operate at IHEP PS U-70 in Protvino, Moscow region.
 Detector is located in positive RF-separated beam with 12.5% of K-meson.

OKA detector

K_{e3} decay selection

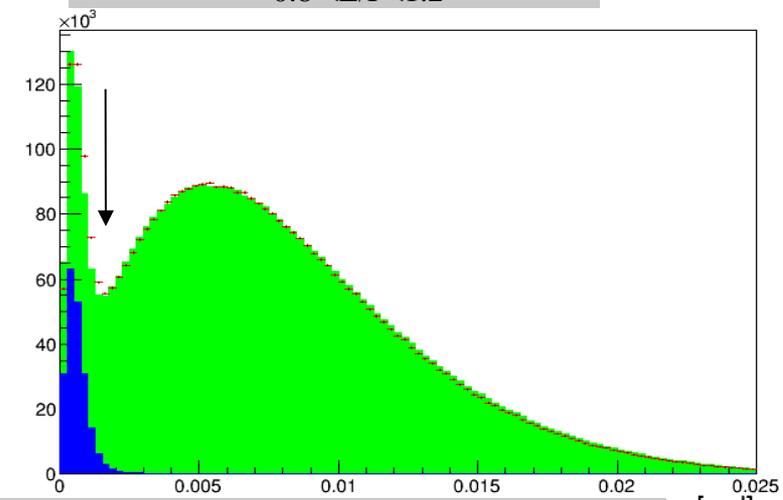

0.8 <E/P<1.2

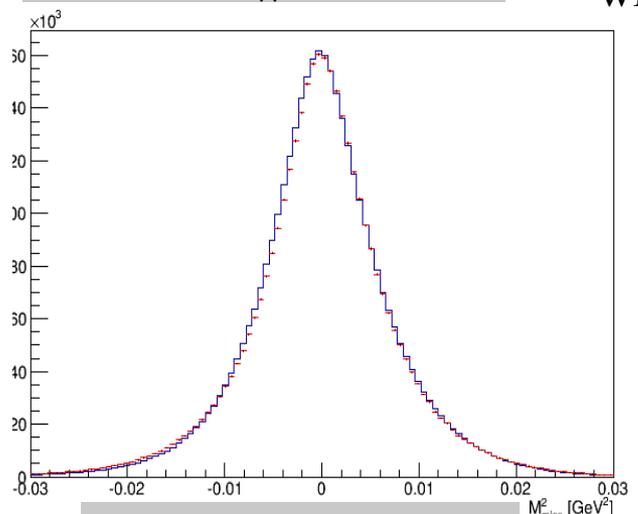

0.11 <Mγγ<0.16 GeV

1. 1 ch. track $\theta > 2\text{mrad}$ point to em-shower in ECAL: ($r < 3\text{cm}$)
.8 <E/P<1.2
2. 2 extra showers ($n_{cl} > 3$);
0.12 <Mγγ<0.15 GeV
3. α -angle between p_K and $p_{e\pi}$
 $\alpha > 2\text{mrad}$
4. 2C -constrained fit $\chi^2 < 20$

6062810 K_{e3} events
with $E_\gamma > 0.7\text{GeV}$

α - angle between p_K and $p_{e\pi}$; $\alpha > 2\text{mrad}$

$M^2_{\text{mis}} = (p_K - p_{e\pi})^2$

$K^+ \rightarrow \pi^0 e^+ \nu \gamma$ events selection

- 1) One positive charged track detected in tracking system and 4 showers ($E_\gamma > 0.7\text{GeV}$) detected in electromagnetic calorimeters GAMS- 2000 and EGS.
- 2) One shower must be associated with charged track.
- 3) Charged track is identified as positron.
- 4) Vertex situated within the decay volume.
- 5) The effective mass $M_{\gamma\gamma}$ for one $\gamma\gamma$ -pair is $0.12 < M_{\gamma\gamma} < 0.15$ GeV.

Background suppression

The main background channels for the decay $\mathbf{K^+ \rightarrow \pi^0 e^+ \nu \gamma}$ are:

- 1) $\mathbf{K^+ \rightarrow \pi^0 e^+ \nu}$ with extra photon. The main source of extra photons are an interactions of positrons in the detector material.
- 2) $\mathbf{K^+ \rightarrow \pi^+ \pi^0 \pi^0}$ where one π^0 photons not detected and π^+ decays to $\mathbf{e^+ \nu}$ or misidentified as positron.
- 3) $\mathbf{K^+ \rightarrow \pi^+ \pi^0 \gamma}$ with fake photon and π^+ decayed or misidentified as positron. Fake photon clusters can come from π^+ hadron interaction in the detector, external bremsstrahlung, accidentals. All these sources are included in our MC calculations.
- 4) $\mathbf{K^+ \rightarrow \pi^+ \pi^0 \gamma}$ when π^+ decays or is miss-identified as an positron.
- 5) $\mathbf{K^+ \rightarrow \pi^0 \pi^0 e^+ \nu}$ when one γ is lost.

Background suppression

- 1) $E_{\text{miss}} > 0.5\text{GeV}, E_{\text{veto}} < 50 \text{ M}\text{\AA}\text{B}, -2200 < Z_{\text{vx}} < -950, E_{\gamma} > 0.7\text{GeV};$
- 2) $|\Delta y| = |y_{\gamma} - y_{e^+}| > 4 \text{ cm}, \Delta y$ - vertical distance in GAMS plane;
- 3) $|x, y|$ of reconstructed “v” $< 100\text{cm}$ in GAMS-2000 plane;
- 4) $|M_{\text{miss}}^2(\pi^0 e^+ \gamma)| < 0.003 \text{ GeV}^2;$
- 5) $M_{\text{K}} > 0.45\text{GeV};$
- 6) $4 \text{ mrad} < \theta_{e\gamma} < 40 \text{ mrad},$

where $M_{\text{miss}}^2(\pi^0 e^+ \gamma) = (\mathbf{P}_{\text{K}} - \mathbf{P}_{\pi^0} - \mathbf{P}_e - \mathbf{P}_{\gamma})^2$,

M_{K} - K meson mass recovered, mass of the $(\pi^0 e^+ \nu \gamma)$ - system, assuming $m_{\nu}=0$.

Experimental data

Results

Results

For $E_\gamma^* > 10\text{MeV}$ and $0.6 < \cos^*\theta < 0.9$ we have 7242 selected events with 544 background events. Comparing this after efficiency correction with ours 6062810 K_{e3} events, for the relative branching ratio we got

$$R = \Gamma(K^+ \rightarrow \pi^0 e^+ \nu \gamma) / \Gamma(K^+ \rightarrow \pi^0 e^+ \nu) = (0.58 \pm 0.01 \pm 0.02) \cdot 10^{-2}$$

Systematic errors are estimated by variation of cuts of Table 1 and using two different ways of backgrounds normalization.

Theoretical prediction for R from CHPT is $R = 0.56 \cdot 10^{-2}$

For T-odd asymmetry we got:

$$A_\xi = -0.009 \pm 0.012$$

Theoretical prediction in Standard Model is $A_\xi = -0.59 \cdot 10^{-4}$.

Results

Table 2

Summary

- 1) OKA collaboration, operating at IHEP Protvino U-70 PS in RF-separated beam, has accumulated large statistics of K^+ decays.
- 2) $K^+ \rightarrow \pi^0 e^+ \nu \gamma$ decay signal is extracted with a low background.
- 3) $R = \Gamma(K^+ \rightarrow \pi^0 e^+ \nu \gamma) / \Gamma(K^+ \rightarrow \pi^0 e^+ \nu) = (0.58 \pm 0.01 \pm 0.02) \cdot 10^{-2}$
for the region $E^*_\gamma > 10$ MeV and $0.6 < \cos^* \theta_{e\gamma} < 0.9$ at statistic 6698 events.
- 4) Asymmetry in the T-odd variable ξ $A(\xi) = -0.009 \pm 0.012$
for the region $E^*_\gamma > 10$ MeV and $0.6 < \cos^* \theta_{e\gamma} < 0.9$

Next step – to measure SD terms.
