

Dark Matter Search in the processes of top quark production

- Theory models and current experimental limits
- Associated top quark production with dark matter
- Dark matter mediator in the production of top quarks

This study was conducted within the scientific program of the National Center for Physics and Mathematics, section #5 «Particle Physics and Cosmology»

Theory models

1506.03116

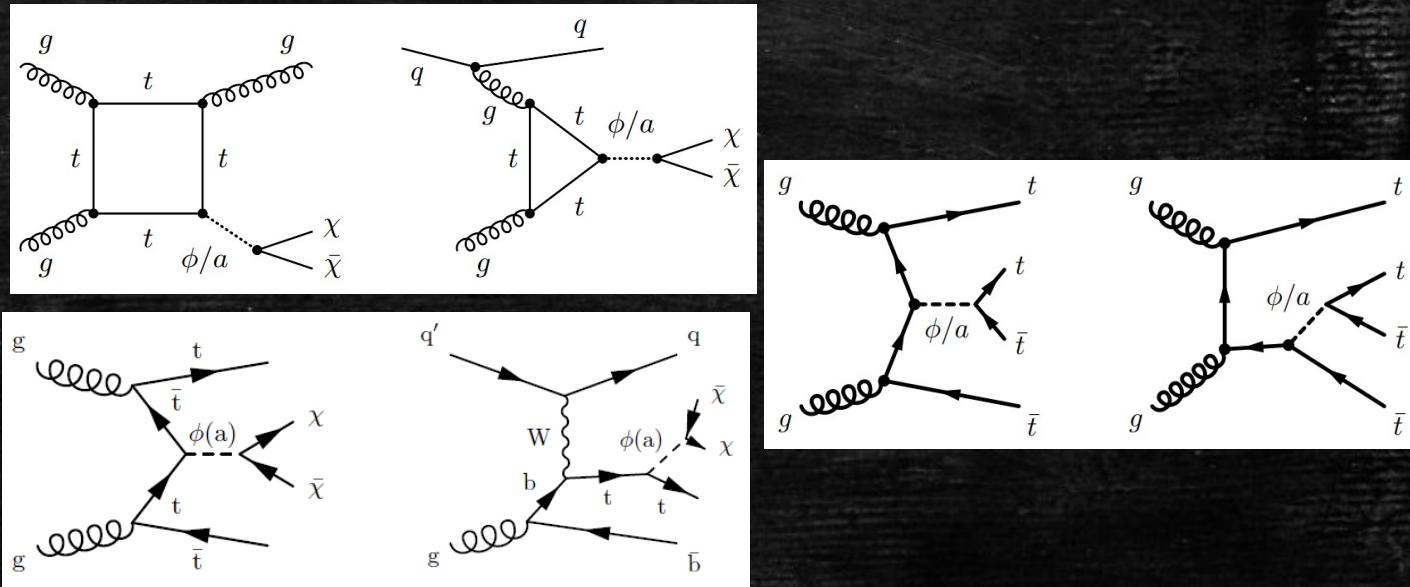

- Simplified models is all we need to model top quark interactions with DM sector, for a while
- Search in:
 - Associated production of top quark and DM;
 - Top quark pair is produced in the decay of DM mediator
- Mostly does not depend on DM mass ($2m_\chi < m_\phi$), quadratically depends on coupling constants (equal 1 in the models, LHC-DM-WG recommendation). The main parameter is the DM mediator mass (m_ϕ)

$$\{m_\chi, m_{\phi/a}, g_\chi, g_u, g_d, g_\ell\}$$

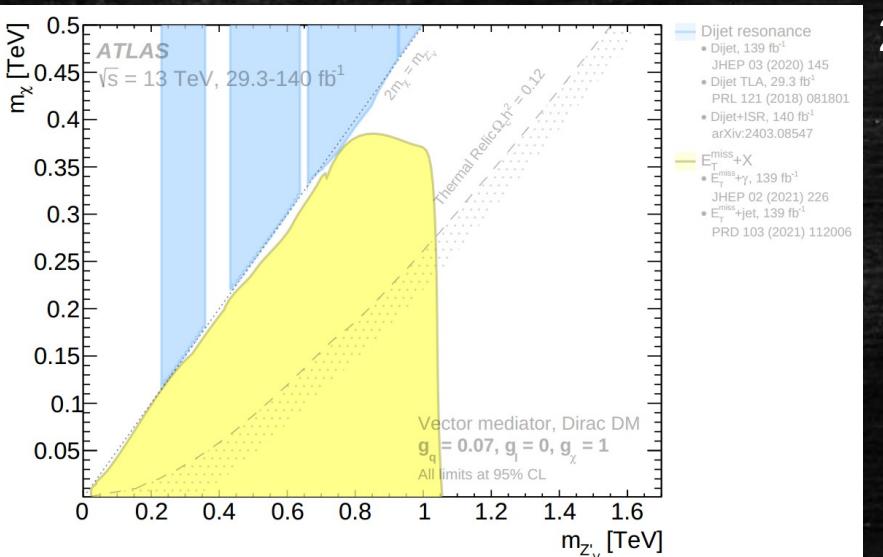

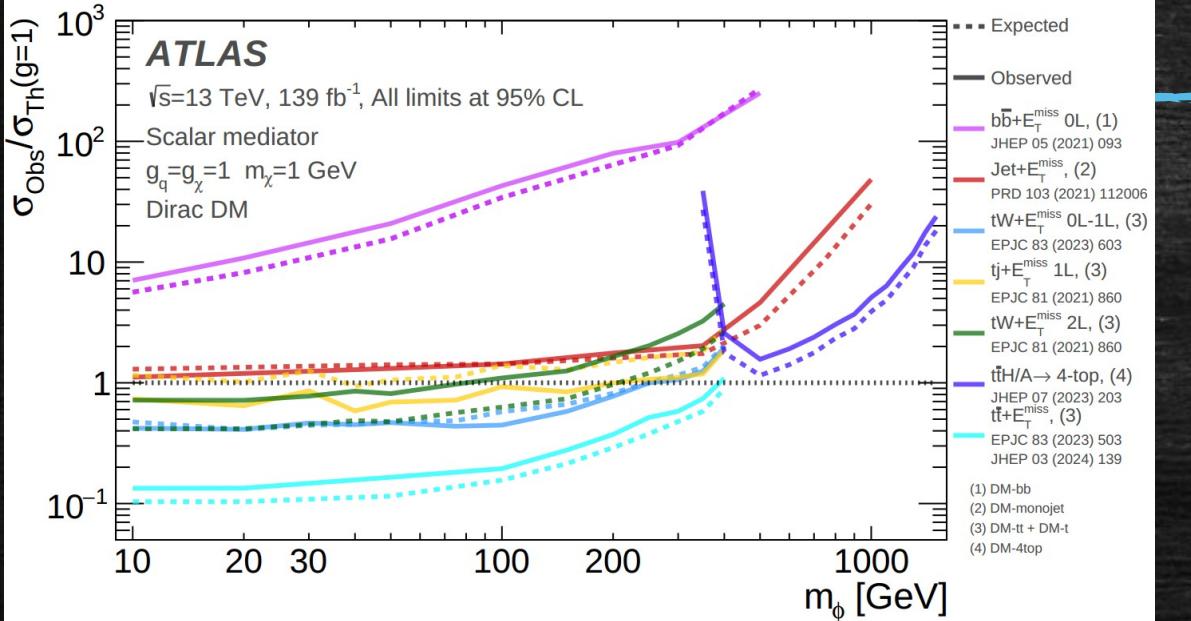

$$L_\Phi = g_\chi \Phi \bar{\chi} \chi + \frac{g_v \Phi}{\sqrt{2}} \sum_f (y_f \bar{f} f)$$

$$L_A = i g_\chi A \bar{\chi} \gamma^5 \chi + i \frac{g_v A}{\sqrt{2}} \sum_f (y_f \bar{f} \gamma^5 f)$$

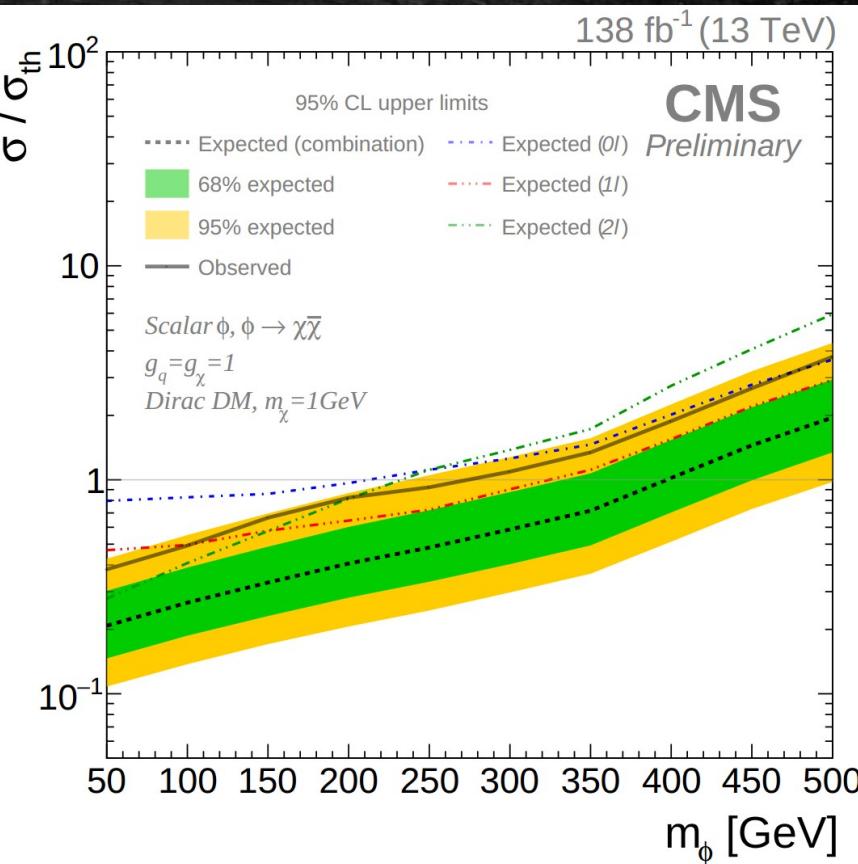

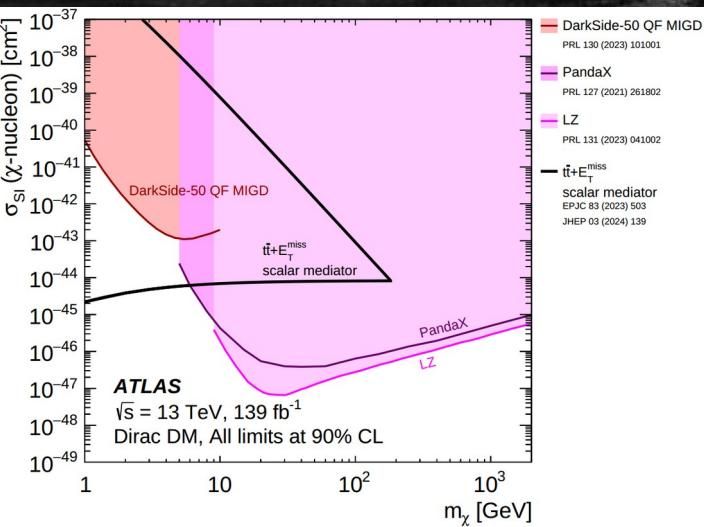

$$\mathcal{L}_{\text{fermion},V} \supset V_\mu \bar{\chi} \gamma^\mu (g_\chi^V - g_\chi^A \gamma_5) \chi + \sum_{f=q,\ell,\nu} V_\mu \bar{f} \gamma^\mu (g_f^V - g_f^A \gamma_5) f,$$

Experimental limits

Search methodology and observables.

New observable has proposed based on well known SM spin correlations in production and decay of top quark.

Need to separate neutrino (from top decay) and mediator contributions to the total missing transverse energy.

Attempt to distinguish analytically neutrino and mediator momentum

$$(P_l + P_\nu)^2 = M_w^2$$

$$(P_l + P_\nu + P_b)^2 = M_t^2$$

$$MET_x = p_{\nu_x} + p_{\phi_x}$$

$$MET_y = p_{\nu_y} + p_{\phi_y}$$

$$P_\phi^2 = M_\phi^2$$

There are no strict analytical restrictions and additional approximations are required, or additional methods.

$$\left(\frac{E_\phi}{M_\phi}\right)^2 - \left(\frac{MET_x - p_{\nu_x}}{M_\phi}\right)^2 - \left(\frac{MET_y - p_{\nu_y}}{M_\phi}\right)^2 - 1 = 0$$

$$p_{\nu_x} = \pm \sqrt{dp_{\nu_y}^2 + ep_{\nu_y} + f} - \frac{\tilde{C}_x}{\tilde{C}_{x^2}} - \frac{\tilde{C}_{xy}}{\tilde{C}_{x^2}} p_{\nu_y}$$

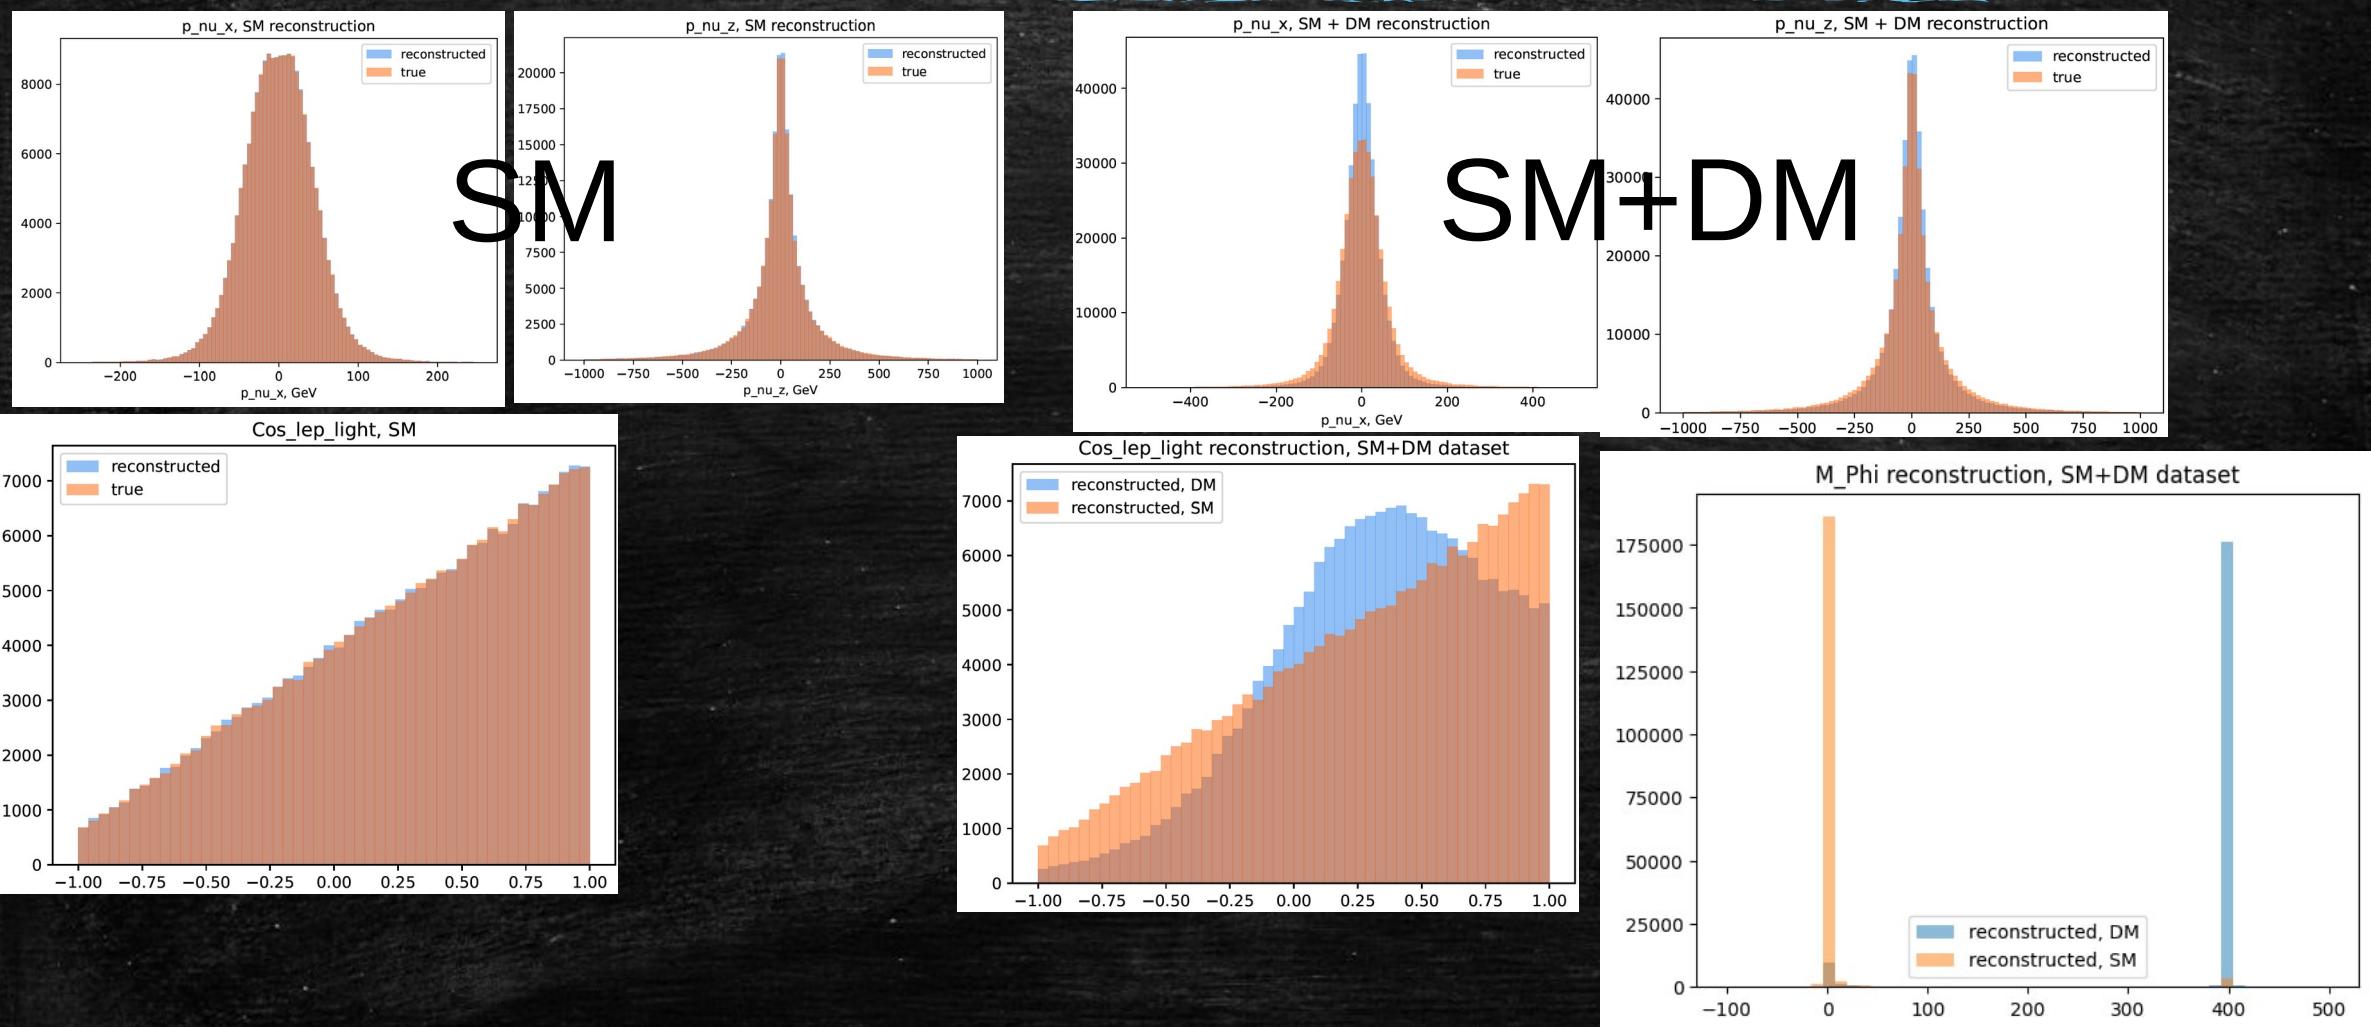

$$d = \frac{\tilde{C}_{xy}^2 - \tilde{C}_{x^2}\tilde{C}_{y^2}}{\tilde{C}_{x^2}^2}, e = \frac{2\tilde{C}_{xy}\tilde{C}_x - 2\tilde{C}_{x^2}\tilde{C}_y}{\tilde{C}_{x^2}^2}, f = \frac{\tilde{C}_x^2 - \tilde{C}\tilde{C}_{x^2}}{\tilde{C}_{x^2}^2}$$

$$\tilde{C} = C^2 - \left(\frac{\tilde{A}}{p_{1b_z}}\right)^2, \tilde{C}_{x^2} = C_x^2 - \left(1 + \left(\frac{p_{1b_x}}{p_{1b_z}}\right)^2\right), \tilde{C}_{y^2} = C_y^2 - \left(1 + \left(\frac{p_{1b_y}}{p_{1b_z}}\right)^2\right),$$

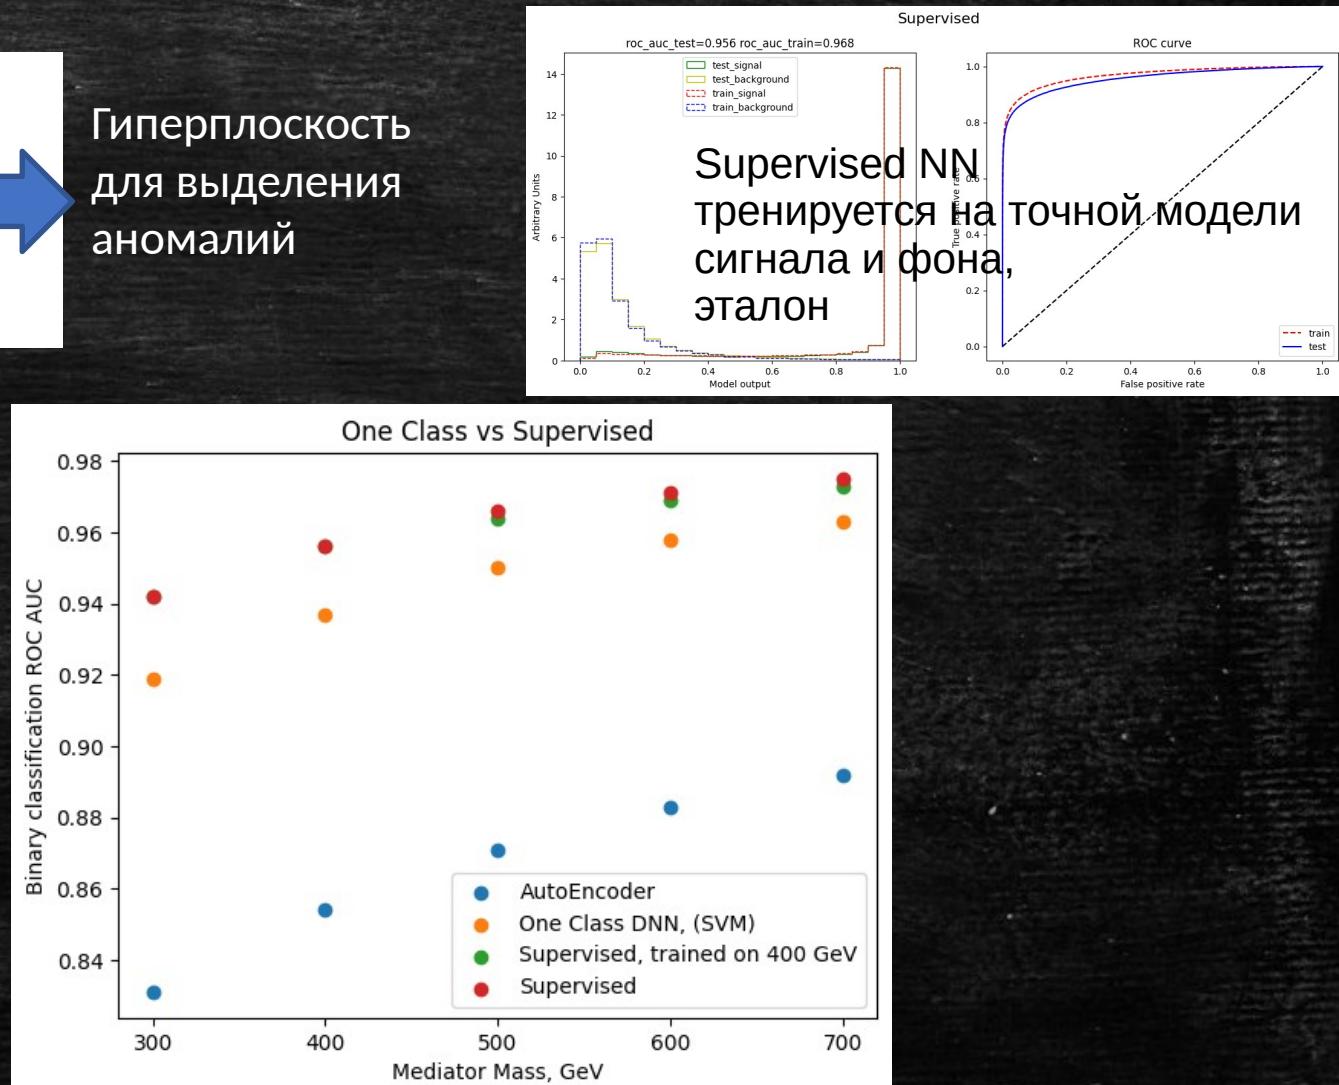

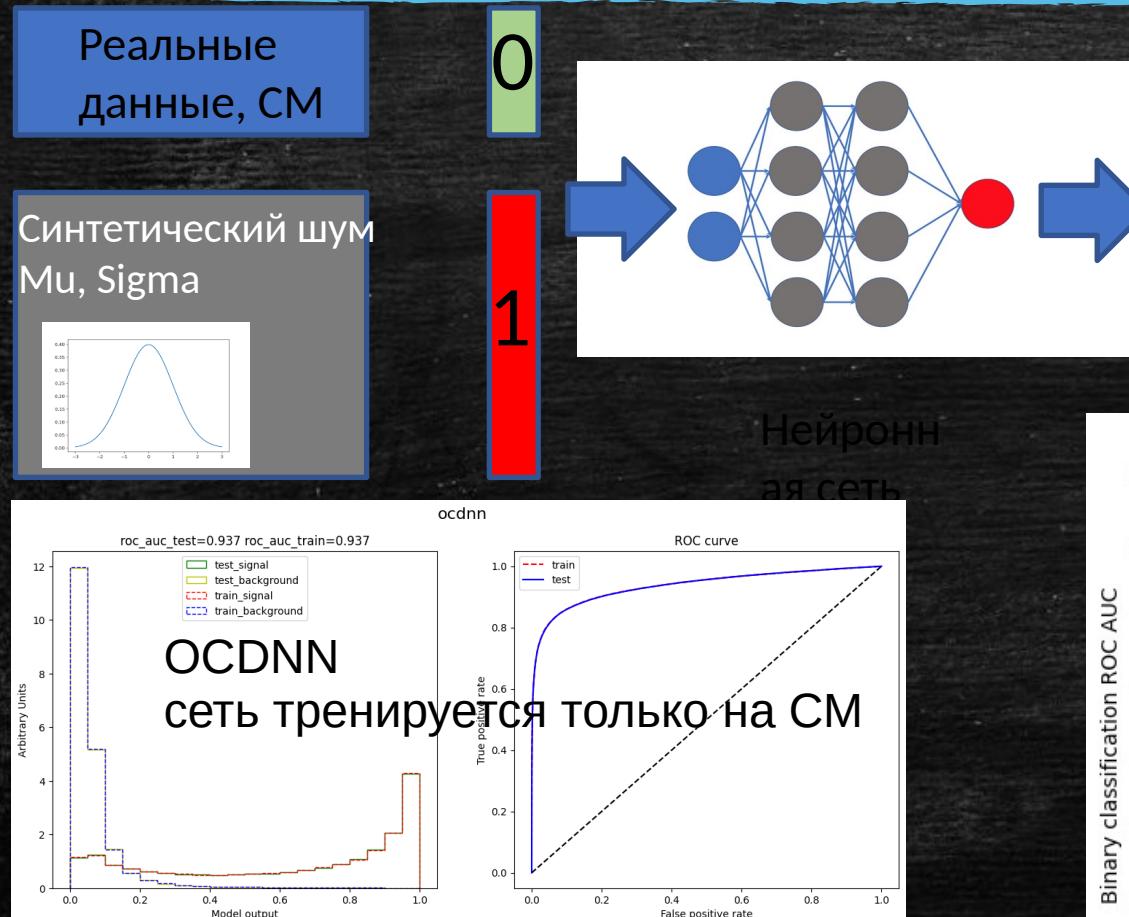

$$\tilde{C}_{xy} = C_x C_y - \frac{p_{1b_x} p_{1b_y}}{p_{1b_z}^2}, \tilde{C}_x = C C_x - \frac{\tilde{A} p_{1b_x}}{p_{1b_z}^2}, \tilde{C}_y = C C_y - \frac{\tilde{A} p_{1b_y}}{p_{1b_z}^2}$$

$$C = \frac{M_w^2 p_{1b_z} - 2p_{l_z}\tilde{A}}{2E_l p_{1b_z}}, C_x = \frac{p_{l_x} p_{1b_z} - p_{l_z} p_{1b_x}}{E_l p_{1b_z}}, C_y = \frac{p_{l_y} p_{1b_z} - p_{l_z} p_{1b_y}}{E_l p_{1b_z}},$$

Application of Deep Neural Networks to reconstruct four-momenta of neutrino and mediator

Метод модельно-независимого поиска отклонений от СМ. Нейронная сеть с одним классом (OCDNN)

Прямой поиск ТМ в процессах с топ-кварком, в разных конечных сигнатаурах

lepton+jets

DM cross section [pb] = 8.9e-03 +- 6.8e-05 pb

Conclusion

- Top quark production processes are very interesting for DM search
- New observable has proposed to distinguish DM and SM contribution. It is based on well known SM spin correlations which are absent or different in DM contribution
- New model independent NN approach has proposed to search for deviations from SM. NN is trained only on the SM events (properties).
- Three and four top quark production processes are very interesting to search for DM mediator which decays to top quark pair. Interference effects have to be taken into account.
